Self-harm and suicidal ideation in children and adolescents in contact with child protection services

Kirstie O'Hare¹, Oliver Watkeys¹, Felicity Harris¹, Kimberlie Dean^{1,2}, Vaughan J Carr^{1,3,4}, Melissa J Green^{1,3}

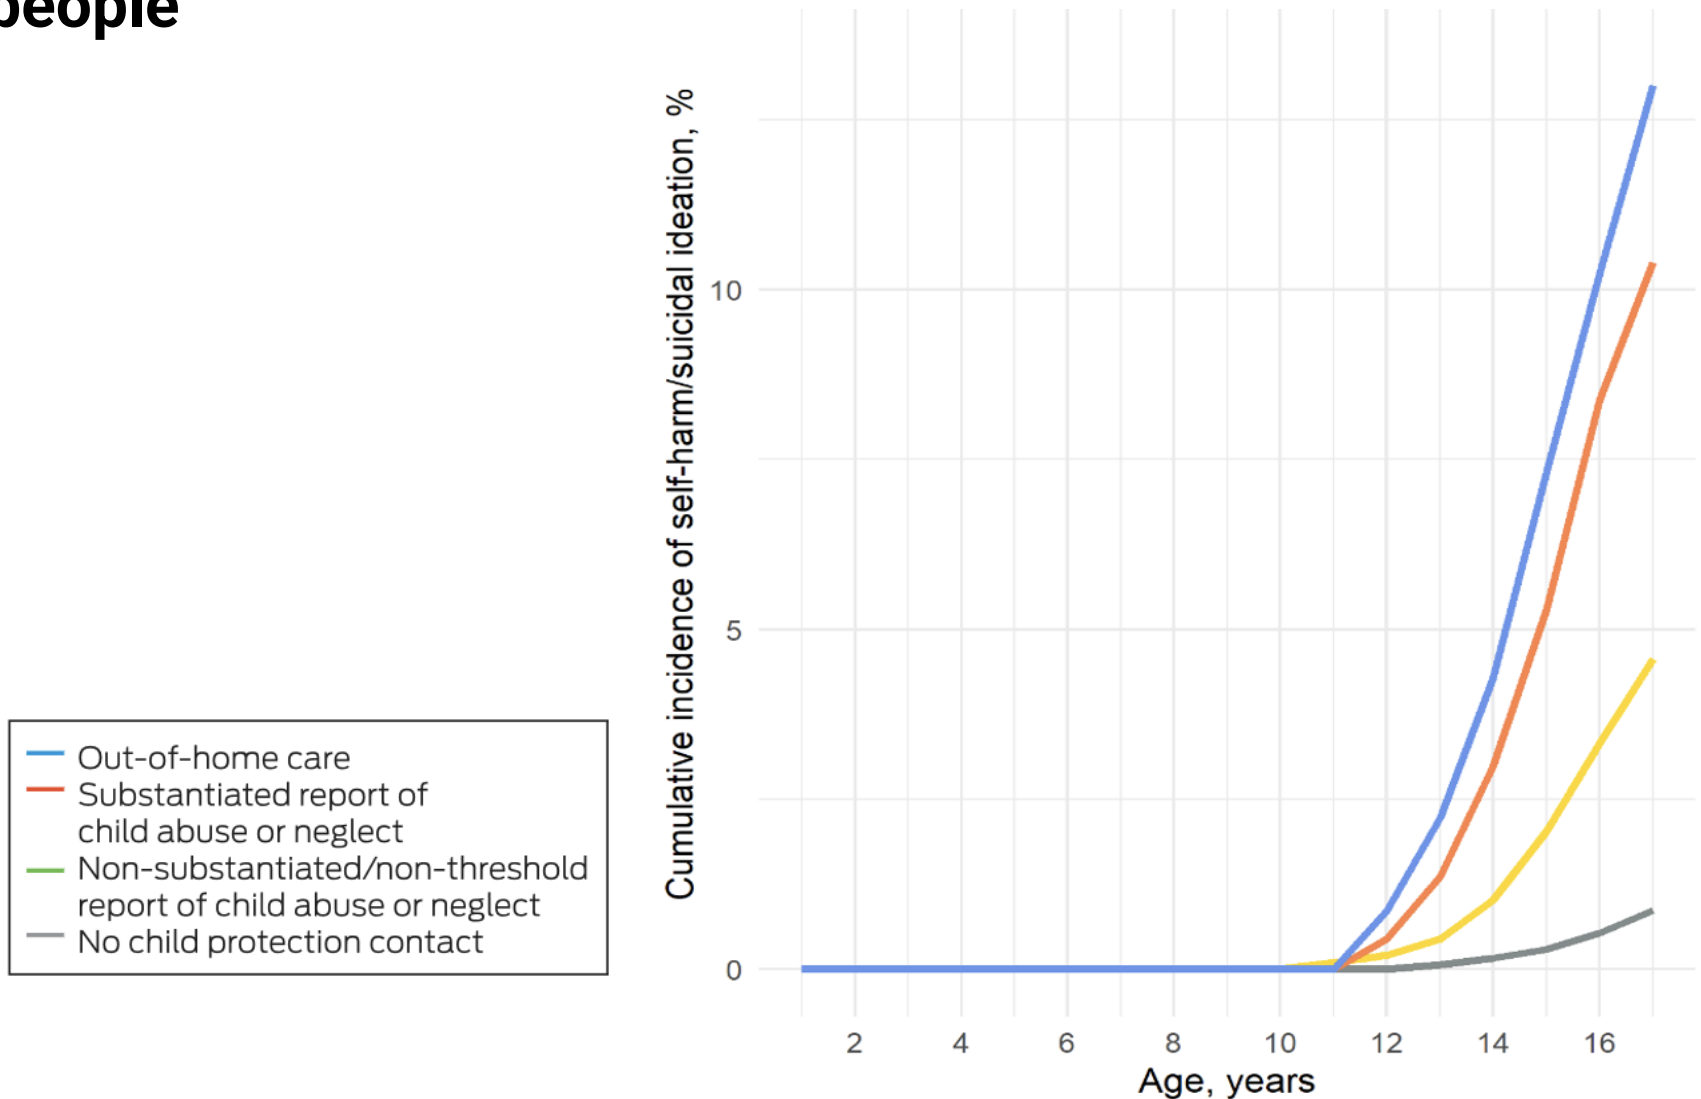

- **By age 17 years, incidents of self-harm or suicidal ideation were recorded in health records for 2233 young people (2.4%).**
- **These incidents were more frequently recorded for girls (3.4%) than boys (1.5%).**
- **More than 74% (1671 young people) of all children with at least one incident of self-harm were known to child protection services in NSW**

1 Characteristics of the New South Wales Child Development Study (wave 3) participants

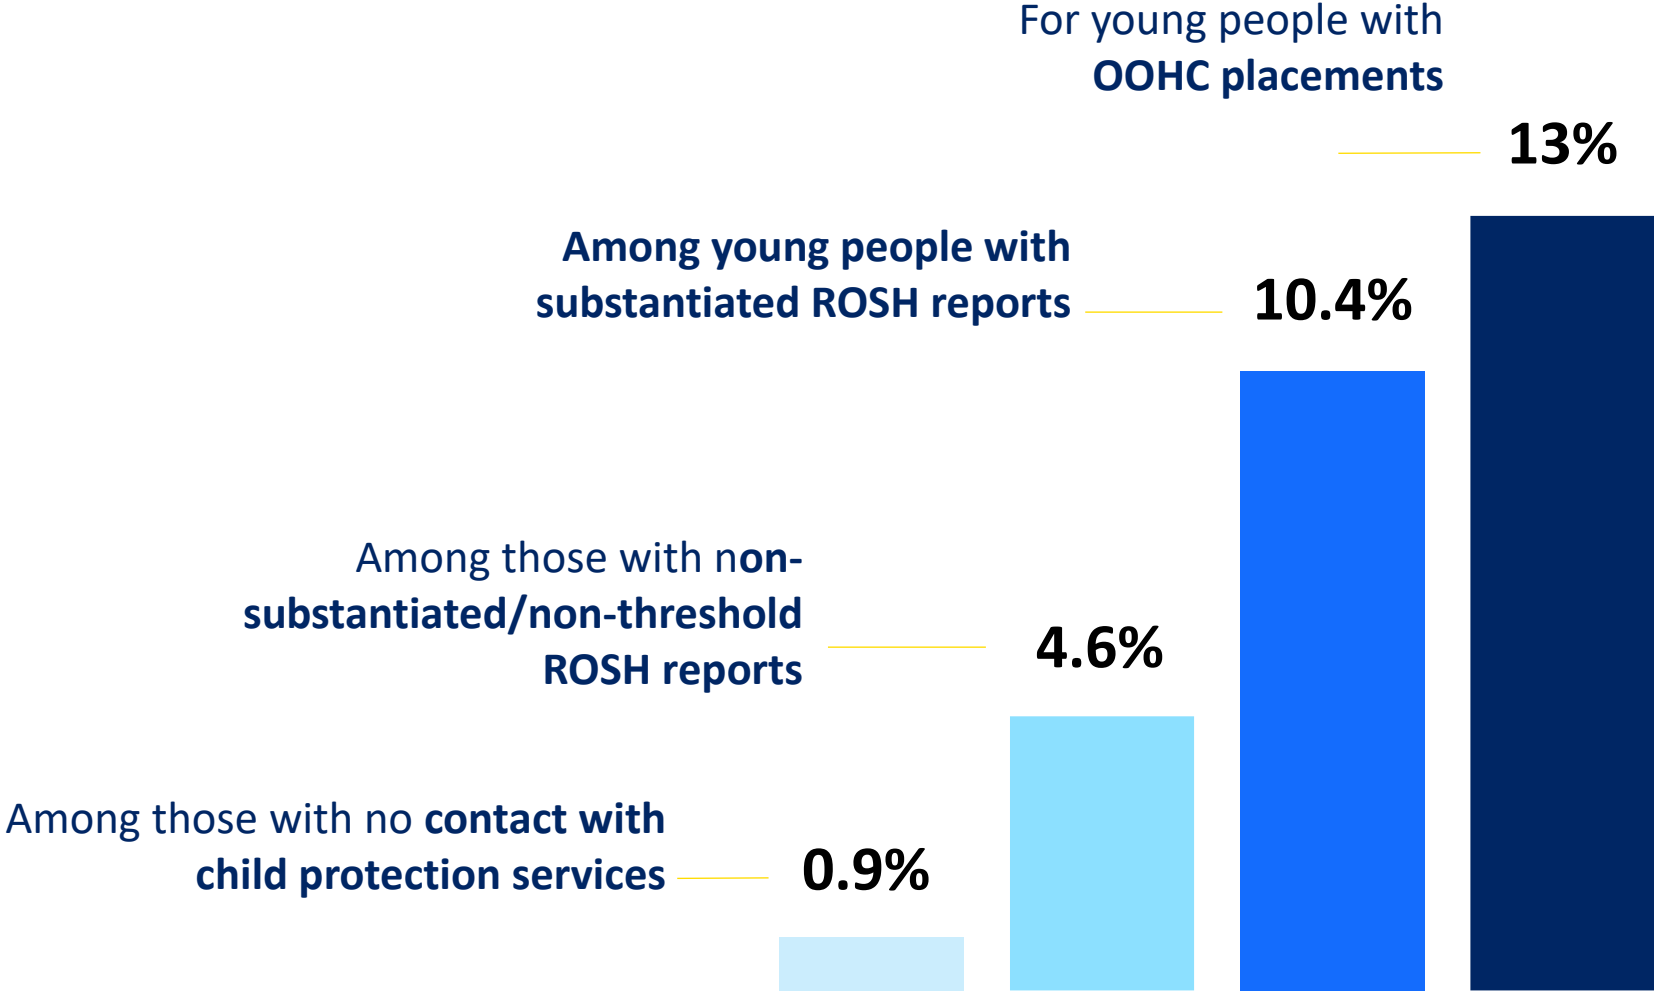

Characteristic	Value
Number of people aged 0–17 years	91 597
Gender (boys)	47 381 (51.7%)
Aboriginal or Torres Strait Islander	7970 (8.7%)
Child protection contact (highest level)	
None	64 851 (70.8%)
Non-substantiated/non-threshold report of abuse/neglect	20 083 (21.9%)
Substantiated report of abuse/neglect	4325 (4.7%)
Out-of-home care	2338 (2.6%)
Recorded incidents of self-harm or suicidal ideation (by 17 years of age)	2233 (2.4%)
Any self-harm	866 (0.9%)
Any suicidal ideation*	1367 (1.5%)

* Excludes people with recorded incidents of self-harm. ◆

Cumulative relative incidence of first self-harm and/or suicidal ideation recorded in NSW/ACT health records according to child protection service level for 91,597 young people

Proportion of young people in each category of child protection service level who had self-harm or suicidal ideation recorded in emergency, hospital, and mental health records by age 17 years

Self-harm and suicidal ideation among young people is more often recorded by child protection than health services in an Australian population cohort

Kristin R Laurens^{1,5}, Vaughan J Carr^{1,6,7} and Melissa J Green^{1,6} **

Also interesting to note that:

- The majority (73.8%) of youth with reported self-harm or suicidal ideation in child protection records did not have any contact with health services for these conditions;
- Girls were more likely than boys to access health services (but not social services) for self-harm or suicidal ideation

Age at first service contact for self-harm or suicidal ideation

The age of first contact for self-harm or suicidal ideation was the **youngest for child protection** services (M=13.8 yrs), and **oldest for police contacts** (M=16.7 yrs). The three health services each had a similar average age at first contact, around 14.5 yrs.

Policy and Practice Implications

- Suicide prevention is not solely the responsibility of health services but requires a whole-of-government, community approach to prevention.
- Child protection services are at the frontline of any suicide prevention effort. Case workers and the police need to be adequately resourced to respond to self-harm and suicidal ideation in children and adolescents to prevent suicide
- Need to explore opportunities for early intervention beyond health services – e.g., real-time data sharing among all government agencies; sharing government data with NGOs; cross-agency emergency responses
